

Passive Pro Five Channel Attenuator

Thank you for purchasing the blue lantern Passive Pro Five Channel Attenuator module.

This module requires no power and is fairly easy to use. I added an additional feature to split a single signal into 5 signals, each with their own level output.

Below is a flow chart to help visualize the internal wiring on the PCB board.

On the panel, the White Ring symbolizes an input. Jack with no white ring are outputs. The jack with a slim ring is the single Switch Jack input which is used to split one signal into 5 signals. In order to use that feature you can not have anything patched into any of the A-E input jacks. If something is patched into one of the input jacks it will internally disconnect the jack switch. Thus breaking away that particular Channel from the splitter.

For normal Attenuator use, just match the same letter.

For example: Input Jack A and use Output Jack A. Adjust Level Knob A. Want to mute Channel A? Then toggle A mute.

Spacing and knob feel is great on this module.

12HP in case your wondering.
